Errata

1) All the stuff about B-format being sub-optimal and resulting in information loss is just plain wrong; or at least, while it's mathematically correct, it's of no practical value, since the Helmholtz equation does hold for all real soundfields. (The moral of this story is: always be suspicious of bright ideas thought up during the last frantic writing-up stage of your PhD work, *especially* if they imply that everybody else has been missing something fundamental, and also let you make up some funky new mathematical notation.)

2) I seem to have used c throughout without defining it anywhere. It is, as usual, the phase velocity of an acoustic plane wave; i.e., the speed of sound.

3) The first row / third column entry of table 4.1 on p. 80 is missing a factor of $1 / \sqrt{2}$.
